

Windows Security Configuration & Evidence Documentation

Purpose

To document selected Windows security configurations using screenshots as evidence and record security observations, impacts, and recommendations.

Scope

This document covers selected Windows security settings, their configuration status, supporting screenshots, and identified security observations.

Prerequisites

The following prerequisites are required before performing the security configuration checks documented in this procedure.

- Windows computer
- Administrator access
- Windows Security application
- Internet connection, if required for security updates
- Permission to review and document security settings

Security Procedure

Windows Firewall Configuration Check

This procedure checks the status of Windows Firewall and records the configuration as evidence.

1. Open **Windows Security** from the Start menu.
2. Select **Firewall & network protection**.
3. Review the status of the available network profiles.
4. Verify whether the firewall is turned **On** or **Off**.
5. Record the observed status and capture a screenshot as evidence.

Evidence: A screenshot of the Windows Firewall status will be captured and included in the documentation.

Screenshots & Evidence

Figure 1: Windows Firewall status showing that the firewall is enabled for Domain, Private, and Public networks.

Expected Result

The Windows Firewall should be enabled for the Domain, Private, and Public network profiles.

Actual Result:

The Windows Firewall is enabled for all three network profiles. The Public network is currently active.

Security Considerations

The Windows Firewall should remain enabled for all network profiles. Firewall settings should only be modified by authorized users, and unnecessary changes to firewall rules should be avoided.

Security Observations / Findings

During the security configuration check, the Windows Firewall was found to be enabled for the Domain, Private, and Public network profiles. No immediate firewall configuration issue was observed.

Finding Status

Status: No issue identified.

Evidence & Findings Table

Observation	Evidence	Impact	Recommendation
Windows Firewall is enabled for Domain, Private, and Public networks.	Screenshot showing Firewall status as On for all three profiles.	No immediate firewall configuration risk was identified.	Continue to keep Windows Firewall enabled and review firewall settings periodically.

Recommendations

Based on the security configuration check, the following recommendations are provided:

- Keep Windows Firewall enabled for Domain, Private, and Public network profiles.
- Review firewall settings periodically to ensure they remain appropriately configured.
- Allow changes to firewall settings only for authorised users.
- Review firewall rules as needed to ensure that unnecessary or insecure rules are not present.
